GEL NANOTECHNOLOGY (MG SERIES)

Gel Nano is an advanced range of sealed-activated batteries, totally sealed units supplied pre-charged and requiring no acid-filling to commission.

Utilising a real gel electrolyte rather than liquid, the Nano-Gel is able to cover the active plate material more effectively, providing a larger effective surface area and preventing lead from sulphation.

The nature of Nano-Gel provides maximum cling to the plates which is able to withstand severe vibration and prolong battery life.

Real gel MG batteries offer more battery cycles and longer shelf life compared to other standard factory-activated batteries on the market.

Gel Nano batteries are available as upgrades for MGS, DTX and DB series batteries.

CONVENTIONAL SEALED-ACTIVATED (MGS SERIES)

Sealed-activated batteries are totally sealed units supplied pre-charged and requiring no acid-filling to commission.

These MGS series batteries are direct standard replacement for OE batteries fitted to the majority of the latest motorcycles.

MAINTENANCE FREE WITH ACID PACKS (DTX SERIES)

Valve regulated lead acid batteries once activated, are totally sealed. This eliminates spills and leakages, making them particularly suitable for motorcycles, ATVs and personal watercraft. Each battery is supplied with an easy-fill acid pack for activation, no further maintenance or topping up is required.

Robust and vibration resistant, maintenance free batteries last up to three times longer than conventional batteries.

HIGH PERFORMANCE DRY CHARGE (DB SERIES)

20-30% more starting power than conventional batteries, more plates per cell give higher cranking performance. Extra power for machines with additional electrical components or high compression engines.

CONVENTIONAL DRY CHARGE (6N & 12N SERIES)

Standard replacement dry charge batteries. General dependable power. High cranking power.

GENERAL BATTERY INFORMATION

How battery's work

Motorcycle batteries contain individual cells, each one produces just over two volts. Six-volt batteries have three cells and twelve volt batteries have six cells. Each cell has stacks of lead plates which are alternately charged positive and negative. The individual plates are separated by an insulator usually made from treated paper or fibreglass. The lead plates in each cell are connected to each other, positive to positive and negative to negative. Each group is then connected to those in the next cell in series (positive to negative).

The clear fluid inside batteries (conventional, high performance and maintenance free) is called electrolyte, a mixture of water and sulphuric acid. In Gel Nano batteries this electrolyte is a gel rather than a liquid. The chemical reaction between the lead and acid produces electricity.

Electricity is produced when the electrolyte in a battery reacts with the lead plates in the cells. The sulphuric acid changes the lead into lead sulphate, and, in doing so deposits free electrons on the positive plates. These electrons cling to the plates until a load is placed on the battery, e.g. when the ignition is turned on. At that time the electrons move from the positive plates to the negative plates producing electrical current.

Electrolyte maintenance

During the charging cycle (initial charging and when installed on motorcycle) a dry-charge battery (6N, 12N, DB) produces water vapour which escapes out of the battery's vent tube. Over time the accumulated water vapour loss causes the fluid level in the battery to decrease. To top up the battery use distilled water, do not use electrolyte.

If the fluid level falls below the LOWER LEVEL shown on the battery casing, the electrolyte will be more concentrated, this stronger acid can corrode the battery's internal components and cause the battery to short out.

Maintenance Free (DTX) and Gel NANO (MG) and Conventional Sealed-Activated (MGS) batteries are sealed units, under no circumstances after activation should the batteries be opened or topped up with electrolyte or distilled water.

Sulphation

This chemical process occurs in batteries that are neglected and allowed to discharge too often without being recharged, or allowed to discharge too deeply (such as motorcycles garaged over winter, without any attention to maintain the battery). It is also caused when fluid levels are allowed to drop and expose the lead plates to air.

During sulphation, crystals of lead sulphate build up on the plates and prevents efficient chemical reaction between the electrolyte and the lead plates. Lead sulphate appears as a white coating over the plates, the damage is usually irreversible. Sulphation can be avoided by maintaining correct fluid levels in dry charge batteries. It is essential to monitor and recharge all types of battery regularly when it is not in use or periods when a motorcycle is stored and unused. A faulty electrical system on a motorcycle can also cause sulphation by not replacing the charge in the battery lost to starting and lighting.

Charge and discharge cycle

All batteries have a limited lifespan as the cycle of charge and discharge that a battery performs is finite due to the continual material loss from the plates during the electro-chemical reaction. Over time a battery will lose its' capacity, this timescale will be less for high-usage motorcycles and vehicles.

Overcharging

A battery will be irreversibly damaged if it is subjected to an excessive charge by a charger or by a faulty motorcycle electrical system. Overcharging can generate heat which evaporates electrolyte, also damaging the plates by increased material loss.

WARRANTY

Dynavolt batteries are guaranteed to be free from any defect in workmanship and materials and to be suitable for the application for which they are recommended by the company.

Dynavolt guarantees all batteries for a full 12 months from date of sale under the following conditions

- } The battery has been well maintained during storage and use in accordance with the charging instructions
- } the battery has been kept at a constant charge of not less than 80%
- } the battery has not been overcharged or allowed to sulphate or deep discharge

CHARGING & MAINTENANCE INSTRUCTIONS

SAFETY INFORMATION

Batteries can be heavy, take care when lifting.

Wear eye protection and protective clothing when handling and charging batteries.

Clean away minor spillages of electrolyte with large volumes of clean water.

If electrolyte contacts skin, rinse the affected area immediately with clean water and if necessary seek medical attention.

If electrolyte contacts eyes, rinse well for several minutes with clean water and seek medical attention.

After use, batteries should be disposed of responsibly and correctly to protect the public and the environment. Guidelines can be found from local authorities for correct collection and disposal.

GENERAL CHARGING INFORMATION

Follow the below instructions to ensure safe and correct charging of batteries. A battery's performance and life expectancy will be compromised if not correctly charged before fitting to vehicle.

Be sure to follow the correct detailed charging instructions that follow for the relevant battery type.

During charging batteries release explosive gases including hydrogen and oxygen. Ensure the charging area is well ventilated to avoid build up of these gases, away from naked flames and ignition sources. Never smoke when handling or charging batteries. Take care to eliminate accidental sparking from any equipment and tools, do not plug in the charger until the leads are connected to the battery.

Always place the battery on a flat and stable surface during the charging process, the work area must be dry and heat resistant. It is recommended to always remove the battery from motorcycle for re-charging.

If the battery becomes hot during the charging process, disconnect the charger and let the battery cool down before reconnecting it.

An automated stage pulse charger is best suited to charge motorcycle batteries, these chargers automatically monitor battery voltage during the charge cycle, switching into standby mode at full charge. Always refer to the manufacturer's instructions for any battery charger that is used. Only use a dedicated motorcycle charger - NEVER use a car charger to charge a motorcycle battery. Follow good lead practice - remove negative lead first and reconnect last.

Voltages should be measured using a voltmeter following the manufacturers instructions.

BATTERY SPECIFIC CHARGING INSTRUCTIONS

GEL NANO (MG SERIES) & SEALED ACTIVATED (MGS)

1. Remove the battery from packaging and place on a flat stable surface
2. Using a voltmeter, check the open circuit voltage of the battery.
 - If the battery voltage is between 12.60v and 13.15v it may be installed on the vehicle without any refresher charge.
 - If the battery voltage is lower than 12.60v the battery must be recommissioned on a charger suitable for sealed lead-acid batteries, as described in point 3.
 - If the battery is being stored it is recommended to fully charge first, checks should be made at least every 4 months to ensure battery is kept above 12.60v.

Never attempt to open the battery casing or add water or electrolyte to the battery

3. Constant voltage charging mode
 - Constant voltage range = 14.40-14.70 V
 - Initial charging current = 0.1-0.5 Cn
 - Charging time = min.6/max.24 hrs

Constant current or power charging mode

- Max.charging current = 0.1 Cn
- Recommended charging time = 5-8 hrs.
- The result [(charging current) x (charging time)] must be within the range 0.5-0.8 Cn.

If other charging procedures are used different from those recommended above, the detailed maximum currents and 24 hours charging duration must not be exceeded.

CHARGING & MAINTENANCE INSTRUCTIONS

BATTERY SPECIFIC CHARGING INSTRUCTIONS cont...

DRY CHARGE (6N, 12N & DB SERIES)

FILLING THE BATTERY WITH ELECTROLYTE

- ~ Remove the battery from packaging and place on a level stable surface
- ~ Use 1.27 specific gravity electrolyte (diluted sulphuric acid) - NOT SUPPLIED
- ~ Remove the filling plugs
- ~ Remove the rubber cap and replace with the exhaust tube provided
- ~ Fill the battery with the electrolyte to the UPPER LEVEL indicated on the battery casing
- Electrolyte temperature must be between 15°C and 30°C when filling*
- ~ Leave the battery to stand for **at least 30 minutes** after filling. If the electrolyte level drops in this time, refill to the UPPER LEVEL before charging
- ~ The battery is now filled and ready to charge

CHARGING THE BATTERY

- ~ Place the battery on a level stable surface
- ~ Ensure filler plugs are removed
- ~ Connect charger and charge for maximum 3 to 5 hours at the approximate current equivalent of 1/10th of the rated capacity
- ~ If electrolyte level falls during charging, fill with distilled water to UPPER LEVEL. After water is added, continue charging for 1 to 2 hours in order to mix the distilled water and electrolyte
- ~ After charging check that the voltage is constant over 3 successive readings taken at 30 minute intervals
- ~ Replace filler plugs firmly and wash off any electrolyte spillage with clean water

State of Charge	CB	Conventional
100%	12.7v	12.6v
75%	12.5v	12.4v
50%	12.2v	12.1v
25%	12.0v	11.9v
0%	11.9v or less	11.8v or less

BATTERY MAINTENANCE

Periodic battery maintenance should be performed even when there is no motorcycle starting problem. The following simple procedures will help prevent premature battery failure.

- ~ Check electrolyte level. Do not allow the level to fall below the LOWER LEVEL line or below any of the tops of plates in cells. Refill with distilled water to the UPPER LEVEL line.

Low electrolyte levels may cause malfunction in the charging system

- ~ Keep battery clean of all dirt and acid spillage, especially around terminals.

- ~ Keep the exhaust tube free of kinks and dirt build-up

- ~ If motorcycle is not in frequent use, additional charging WILL be required.

- ~ Before recharging ensure filler plugs are removed

- ~ Charging rates will vary depending on...

- Battery's electrical capacity
- Temperature of electrolyte
- Battery's state of charge at start of charging
- Battery's age and condition
- Type of charger

KEEP THE BATTERY AT 100% STATE OF CHARGE

MAINTENANCE FREE (DTX SERIES)

FILLING THE BATTERY WITH ELECTROLYTE

- ~ Remove the battery from packaging and place on a level stable surface
- ~ **Use only the electrolyte provided with the battery**
- ~ Remove the sealing strip from the top of battery
- ~ Remove packaging and caps from the electrolyte pack.
- DO NOT pierce the seals on the feeders*
- ~ Invert the electrolyte pack and align the feeders into the filler ports in the battery
- ~ Press firmly down on the electrolyte pack until the seals break - the electrolyte should flow into the battery and bubbles of air should rise into the electrolyte pack.
- DO NOT tilt the electrolyte container*
- ~ Leave the electrolyte pack in this position for at least 20 minutes, to allow all electrolyte to pass into the battery
- If bubbles do not appear in the electrolyte pack, gently tap the bottom of the pack 2 or 3 times to start the flow. DO NOT remove the pack from the battery*
- ~ When the pack is completely empty of electrolyte, slowly pull the pack away from the battery

There will be no electrolyte visible in the battery, all electrolyte will have been absorbed into the battery separators and plates

- ~ Place the cap strip securely into the filler ports. Ensure the cap strip is inserted fully and flush with the battery top

The battery is now activated and ready to charge.

Never attempt to remove the cap strip or add water or electrolyte to the battery

CHARGING THE BATTERY

This is a sealed maintenance free construction battery, this means:

- ~ Water must never be added

- ~ It must be charged with a 12V 1Amp motorcycle battery charger, at the correct rate to suit the specific battery model as indicated below.

If the battery becomes very hot during charging, stop charging and allow the battery to cool

- ~ Add the electrolyte and seal the battery as described above

- ~ Place the battery on a level stable surface

- ~ Using a 12V 1Amp motorcycle charger, charge the battery for the following times

Using a 1 amp charger*

YTX4 - 2 hours	YTX5 - 2.5 hours	YTX7 - 3.5 hours
YTX9 - 4.5 hours	YTX12 - 12 hours	YTX14 - 14 hours
YTX16 - 16 hours	YTX20 - 20 hours	

* Charging rates shown are recommended for the first initial charge. Charging rates will vary depending on charger type used. Use of a taper or trickle charger may require a longer charging time

- ~ After charging time has elapsed, remove the charger and allow the battery to sit for 2 hours

- ~ Check the open circuit voltage of the battery, it should be a minimum of 12.8v to 13.0v. If the voltage is less than 12.8 volts, repeat the charging cycle.

- ~ When voltage is 12.8 volts or more, it is ready to install onto motorcycle

State of Charge	Voltage
100%	13.0 Volts
75%	12.8 Volts
50%	12.5 Volts
25%	12.2 Volts
0%	12.0 Volts or less

BATTERY MAINTENANCE

Periodic battery maintenance should be performed even when there is no motorcycle starting problem. The following simple procedures will help prevent premature battery failure.

- ~ Keep battery clean of all dirt, especially around terminals

- ~ If motorcycle is not in frequent use, additional charging WILL be required.

- ~ Charging rates will vary depending on...

- Battery's electrical capacity
- Battery's state of charge at start of charging
- Battery's age and condition
- Type of charger

KEEP THE BATTERY AT 100% STATE OF CHARGE
